

aiias

# alias

- `~/.gitconfig` in the `[alias]` section
- Simple aliases:
  - `myalias = x y z`
  - `git myalias` now runs `git x y z`
- Arbitrary aliases:
  - `complexalias = !some && shell cmd doing > whatever`
  - `git complexalias` now runs that literal command
  - Can even use positional arguments in your alias but it's complicated
